## Report for *in vivo* tests in containers with Panatop Immuno Save

Place of conducting: Laboratory of Phytopharmacy and Ecotoxicology of Pesticides, Agricultural University – Plovdiv

Methodology: Standard *in vivo* tests were conducted with 2 wheat varieties. „Avenil C2” and „Tsarevets”. Measurements were taken 14 days after the treatment of the plants by determining the length of the plants before and after the treatment, the presence of phytotoxic manifestations such as necrosis, chlorosis, deformations of the above-ground parts of the plants and the roots.

### Results:

Variety „Avenil C2”

Trial group	% change compared to the control group
Panatop Immuno Save - 0.3%	48,8 %
Panatop Immuno Save - 0.5%	15.7 %

Variety „Tsarevets”

Trial group	% change compared to the control group
Panatop Immuno Save - 0.3%	52,3 %
Panatop Immuno Save - 0.5%	16.0 %

## Conclusion

The tested product Panatop Immuno Save was able to significantly stimulate plant growth and development even 14 days after the treatment with 0.3% solution. However, increasing the concentration of the treatment solution to 0.5% decreased the effect of the product, which should be taken into account when using it. No phytotoxicity was manifested in the treated plants. There were no statistically proven differences between the two tested varieties in the ANOVA analyzes ( $p > 0.05$ ).
